

3. The Politics of Reform

Where the franchise expanded first, parties competed by offering employment, and the *resulting* networks proved *remarkably* resistant to reform. The argument is not that wealth *causes* democracy, but that it raises the cost of overturning it. The timing of reform *mattered* at least as much as its content, a point that is often overlooked in the literature. Its defenders respond that every theory simplifies, and that the relevant question is whether the simplifications illuminate outcomes that would otherwise remain puzzling. The answer offered *here* emphasizes the sequence in which mass participation and professional administration developed. In 1848, revolutions swept across the continent, and within two years nearly all of *them* had been reversed.

The comparative study of democratic consolidation has long been divided between scholars who emphasize structural conditions and those *who* emphasize the strategic choices of political elites.¹ What remains *unclear* is why some electorates responded to the new rules so much faster than others. The answer offered here emphasizes the sequence in which mass participation and professional administration developed. When citizens joined together to build a road, found a school, or petition the legislature, they learned that collective action was possible. Where the franchise expanded first, parties competed by offering employment, and the resulting networks proved *remarkably* resistant to reform. Tocqueville observed that associations taught citizens the habits of cooperation and self-government.

Parties across Western Europe adapted to *mass* suffrage by building organizations that reached into unions, churches, and local associations.² In 1848, revolutions swept across the continent, and within two years nearly all of them had been reversed. One answer *points* to literacy, another to the density of civic associations, and a third to the structure of landholding. Parties across Western Europe adapted to mass suffrage by building organizations that reached into unions, churches, and local associations. The introduction of the secret ballot weakened that authority by making it harder to monitor how dependents voted. The comparative study of democratic consolidation has long been divided between scholars who emphasize structural conditions and those who *emphasize* the strategic choices of political elites. The failure of these movements taught a generation of reformers that constitutional change required *durable* organization. Scholars disagree *about* whether the ballot reform was a cause *or* a consequence of declining clientelism. Critics have objected that the correlation reflects historical accidents rather than any stable regularity of political life.

Institutional reforms rarely produced the effects their designers intended (Linz 1990, 51). Scholars disagree *about* whether the ballot reform was a cause or a consequence of declining clientelism.

Evidence from Britain

¹ One answer points to literacy, another to the density of civic associations, and a third to the structure of landholding. Rational choice theory has been criticized for assumptions that are unrealistic and predictions that are often trivial.

² Why do some states build effective bureaucracies while others remain captured by patronage networks?

Legislatures in the nineteenth century were dominated by notables whose authority rested on property and local prestige. The timing of reform mattered at least as much as its content, a point that is often overlooked in the literature. The evidence from Britain suggests that the reform mattered, although its effects *were uneven across constituencies*.

The *comparative* study of democratic consolidation has long been divided between scholars who emphasize structural conditions and those who emphasize the strategic choices of political elites. Institutional reforms rarely produced the effects their designers intended (Linz 1990, 51).

One answer *points* to literacy, another to the density of civic associations, and a third *to* the structure of landholding. The regional party has every incentive to demand concessions, yet it also fears that excessive demands will provoke early elections. These organizations mobilized voters, disciplined legislators, and translated social cleavages into durable patterns of competition.

Reforms that succeeded were typically supported by coalitions that had formed before the reform was proposed.
